### ABSTRACT

*A long standing conjecture in the dimension theory for finite ordered sets asserts that every ordered set (of at least three points) contains a pair whose removal decreases the dimension at most one. Two stronger conjectures have been made:*

- (1) *If  $(x, y)$  is a critical pair, then  $\dim(P) \leq 1 + \dim(P - \{x, y\})$ .*
- (2) *For every  $x \in P$ , there exists  $y \in P - \{x\}$  so that  $\dim(P) \leq 1 + \dim(P - \{x, y\})$ .*

*K. Reuter has disproved conjecture 1 by constructing a four-dimensional poset  $P$  containing a critical pair  $(x, y)$  so that  $\dim(P - \{x, y\}) = 2$ . In this note, we construct for every  $n \geq 5$  an  $n$ -dimensional poset  $P_n$  containing a critical pair  $(x, y)$  so that  $\dim(P_n - \{x, y\}) = n - 2$ . Point  $y$  is a maximal point of  $P_n$ .*

### 1. Preliminaries

Recall that the *dimension* of a finite ordered set  $P$  is the least positive integer  $t$  so that there exist  $t$  linear extensions  $L_1, L_2, \dots, L_t$  so that  $P = L_1 \cap L_2 \cap \dots \cap L_t$ . An incomparable pair  $(x, y)$  is called a *critical pair* if any point less than  $x$  is less than  $y$  and any point greater than  $y$  is greater than  $x$ . The dimension of  $P$  is the least  $t$  for which there exist  $t$  linear extensions of  $P$  so that for every critical pair  $(x, y)$ , there is at least one  $i$  for which  $y < x$  in  $L_i$ . We refer the reader to the survey article [3] by D. Kelly and W.T. Trotter and the chapters [6], [7] by Trotter for additional background information on dimension theory.

2. Removable Pairs

The following conjecture is one of the best known open problems in dimension theory and is a featured problem in ORDER. We believe the first reference to the conjecture is [1].

**Conjecture 0** *If  $P$  is an ordered set having at least three points, then  $P$  contains a distinct pair  $(x, y)$  so that  $\dim(P) \leq 1 + \dim(P - \{x, y\})$ .*

A pair  $x, y \in P$  for which  $\dim(P) \leq 1 + \dim(P - \{x, y\})$  is called a *1-removable pair*, so that Conjecture 0 asserts that every poset contains a 1-removable pair.

The first reference to the following conjecture is apparently [5].

**Conjecture 1** *Every critical pair is 1-removable.*

In [2], D. Kelly made the following conjecture which is also stronger than Conjecture 0.

**Conjecture 2** *For every  $x \in P$ , there is a point  $y \in P - \{x\}$  so that  $x, y$  is a 1-removable pair.*

K. Reuter [4] has disproved Conjecture 1 by constructing the ordered set shown in Figure 1. This ordered set  $P$  has dimension 4,  $(x, y)$  is a critical pair, and  $\dim(P - \{x, y\}) = 2$ . Note that  $y$  is a maximal point.

Figure 1

The purpose of this note is to show that Reuter's example is not an isolated phenomenon. To accomplish this, we will establish the following result.

**Theorem** *For every  $n$ , a critical pair  $(x, y)$  is 1-removable, i.e.,  $\dim(P - \{x, y\}) = \dim(P) - 1$ .*

**Proof** For  $n = 4$ , we have a set of  $P_n$  contains  $4n - 4$  points  $\{c_i : 1 \leq i \leq n - 2\} \cup \{d_i : 1 \leq i \leq n - 2\}$  and  $i \neq j$ , we have  $c_i < d_j$ . We also have  $w < z$ .  $n = 5$ .

We first show that  $d_1, d_2, \dots, d_{n-1}$  be linearly independent. In general, we may assume  $x > y$  in  $L_{n-1}$  and  $d_2, \dots, d_{n-2}$ , there exists  $d_i$ .

**Theorem** For every  $n \geq 4$ , there exists an  $n$ -dimensional ordered set  $P_n$  containing a critical pair  $(x, y)$  so that  $y$  is a maximal element in  $P_n$ , but  $(x, y)$  is not  $1$ -removable, i.e.,  $\dim(P - \{x, y\}) = n - 2$ .

**Proof** For  $n = 4$ , we have Reuter's example shown in Figure 1. For  $n \geq 5$ , the point set of  $P_n$  contains  $4n - 4$  points labelled  $\{a_i : 1 \leq i \leq n - 2\} \cup \{b_i : 1 \leq i \leq n - 2\} \cup \{c_i : 1 \leq i \leq n - 2\} \cup \{d_i : 1 \leq i \leq n - 2\} \cup \{x, y, z, w\}$ . For all  $i, j$  with  $1 \leq i, j \leq n - 2$  and  $i \neq j$ , we have the cover relations  $a_i < b_j$  and  $c_i < d_j$ . For each  $i$  with  $1 \leq i \leq n - 2$ , we have  $a_i < y, c_i < y, c_i < x, z < b_i, w < b_i, w < d_i, x < b_i$ , and  $z < d_i$ . We also have  $w < y$ . We illustrate this definition with a diagram for  $P_n$  when  $n = 5$ .

Figure 2

We first show that  $\dim(P_n) \geq n$ . To the contrary, suppose  $\dim(P_n) \leq n - 1$ , and let  $L_1, L_2, \dots, L_{n-1}$  be linear extensions whose intersection is  $P_n$ . Without loss of generality, we may assume that  $b_i < a_i$  in  $L_i$  for  $i = 1, 2, \dots, n - 2$ . Thus we must have  $x > y$  in  $L_{n-1}$  and  $z > y$  in  $L_{n-1}$ . However, this implies that for each  $i = 1, 2, \dots, n - 2$ , there exists a unique  $j_i \in \{1, 2, \dots, n - 2\}$  so that  $c_i > d_i$  in  $L_{j_i}$ . Hence

$w > x$  in  $L_{n-1}$  also. But this implies that  $w > x > y$  in  $L_{n-1}$  which is impossible since  $w < y$  in  $P_n$ . The contradiction completes the proof that  $\dim(P_n) \geq n$ .

We observe that  $y$  is maximal element of  $P_n$  and that  $(x, y)$  is a critical pair. We now show that  $\dim(P_n - \{x, y\}) \leq n - 2$ . To accomplish this, consider the poset  $Q_n = P_n - \{x, y\}$ . In  $Q_n$ , we observe that  $z$  and  $w$  have duplicated holdings so that  $\dim(Q_n - \{z\}) = \dim(Q_n)$ . Let  $Q'_n = Q_n - \{z\}$ . We show that  $Q'_n$  has  $n - 2$  linear extensions which intersect to give  $Q'_n$ . Let  $A = \{a_1, a_2, \dots, a_{n-2}\}$ ,  $B = \{b_1, b_2, \dots, b_{n-2}\}$ ,  $C = \{c_1, c_2, \dots, c_{n-2}\}$  and  $D = \{d_1, d_2, \dots, d_{n-2}\}$ .

For  $i = 1, 2$ ,  $L_i$  is any linear extension of  $Q'_n$  so that  $A - \{a_i\} < C - \{c_i\} < w < d_i < c_i < b_i < a_i < B - \{b_i\} < D - \{d_i\}$ . For  $i = 3, 4, \dots, n - 2$ ,  $L_i$  is any linear extension of  $Q'_n$  so that  $w < C - \{c_i\} < d_i < c_i < D - \{d_i\} < A - \{a_i\} < b_i < B - \{b_i\}$ . It is easy to see that any family constructed by these rules forms a realizer. With this observation, our proof is complete.  $\square$

We pause to note that the construction given in the preceding family for  $\{P_n : n \geq 5\}$  does not work for  $n = 4$ . In this case,  $\dim P_n = 4$ , but  $\dim(P_n - \{x, y\}) = 3$ . Thus to handle the case  $n = 4$ , we need a special example, and Reuter's construction suffices.

### 3. Concluding Remarks

We view the results of this note as providing additional evidence as to the difficulty of Conjecture 0, but we are unable to decide whether our theorem argues for or against the conjecture. It is easy to see that the examples satisfy Conjecture 2, so at least this stronger form of the original conjecture remains open.

## On the Num

Let  $V(G)$  be the set of vertices of  $G$ . A subset  $S$  of  $V(G)$  is called a  $m$ -independent set if  $|S \cap e| \leq m$  for every edge  $e$  of  $G$ . Let  $\alpha(G, m)$  denote the number of  $m$ -independent sets of  $G$ . Let  $\chi(G)$  denote the chromatic number of  $G$ . Let  $\chi(G, m)$  denote the number of  $m$ -independent sets of  $G$  which are maximal with respect to inclusion. Let  $\chi(G, m, n)$  denote the number of  $m$ -independent sets of  $G$  which are maximal with respect to inclusion and have size  $n$ . Let  $\chi(G, m, n)$  denote the number of  $m$ -independent sets of  $G$  which are maximal with respect to inclusion and have size  $n$ . Let  $\chi(G, m, n)$  denote the number of  $m$ -independent sets of  $G$  which are maximal with respect to inclusion and have size  $n$ .

### 1. Introduction

The definitions in this paper are for undirected labelled graphs  $G = (V, E)$  with sets of vertices and edges. The number of vertices is denoted by  $|V|$ . We assume  $G$  is a  $(v, e)$ -graph. Let  $\{x, y\}$  be an edge of  $G$  obtained from  $G$  by deleting the edge  $\{x, y\}$  correspondingly the complete graph  $K_n$  (edge), the completely disconnected graph  $\overline{K}_n$  (vertices), and the complete graph  $K_n$  (vertices). By  $G + H$  we mean the disjoint union of  $G$  and  $H$ . For  $x \in V(G)$ , by  $N_G(x)$  we denote the set of vertices adjacent to  $x$  in  $G$ .
